---

Jim,

If you are still around, I wanted to get a sense of the advantages to operating the Turbosorp system as wet vs. a dry system. Would operating a wet system save money as far as disposal costs? Is it easier operationally and/or does it save time to run the system as a wet system? Maybe you could provide the rationale for switching from a dry to wet system in your modification request (actually an addendum to your original reapplication of 1997) and briefly describe the differences of wet vs. dry operations.

Thanks

---

Hi George,

Attached you will find a pdf document with all attached files combined into one document. Hopefully it's not too large for the email systems to handle.

Separately I am sending an envelope with hard-copy of the same including larger prints of the two attachments, Att2 and Att3 which are the piping drainage diagram and the water balance diagram. They are included in the attached document but may be a bit difficult to read in the small format.

Once I am back from vacation, we will complete the NPDES Permit Modification Request on the appropriate forms.

As I will be on vacation next week, if you have questions, you can call Howie Person at 413-536-9562 or send him an email.

Regards ...

*Please note new schedule below, effective 12-5-2012.*
